

BNP

Daniel J. Fink, MD, MPH
 Director, Core Laboratory
 New York Presbyterian Hospital
 Columbia University Medical Center
 New York, New York

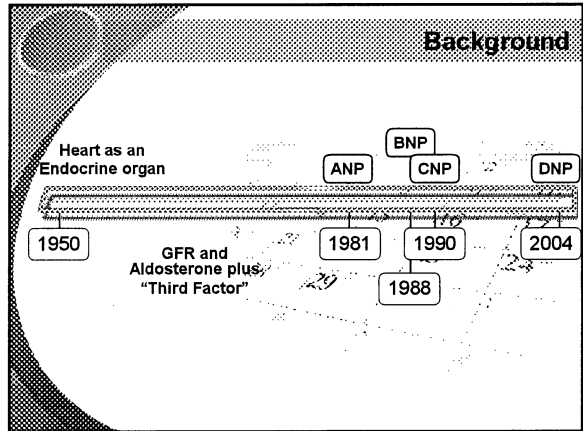

October 6, 2006

Outline

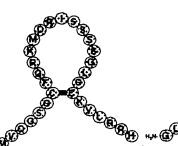

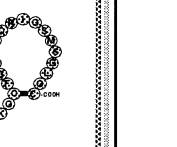

- The Biochemistry of Natriuretic Peptides
- Congestive Heart Failure
- Diagnosis and Management of CHF
- Clinical Chemistry of BNP Assays
- Questions

Learning Objectives

- Synthesis and types of BNP
- Physiologic Actions of BNP
- Utility of BNP in the Diagnosis of CHF
- Caveats in interpreting BNP Results
- Utility of BNP versus NT-ProBNP Assays

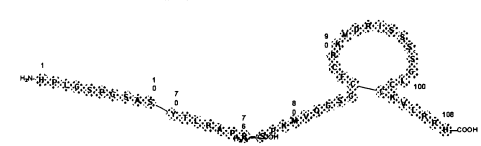

Natriuretic Peptides

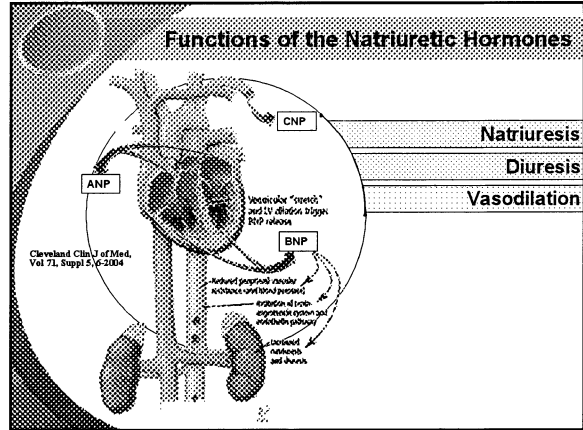

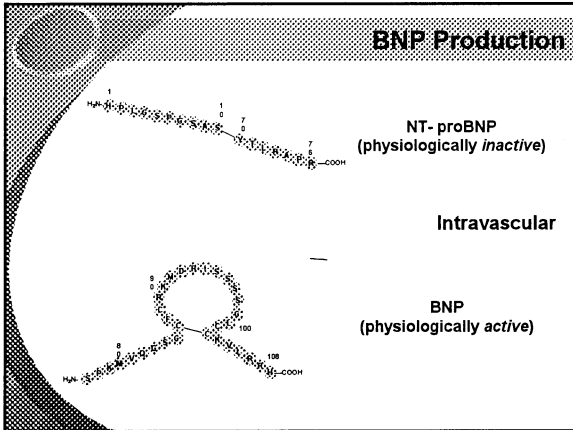

Half-life of	Half-life of	Half-life of
3-5 minutes	18 minutes	2.6 minutes
		
ANP 28 aa peptide	BNP 32 aa peptide	CNP 22 aa peptide

BNP Production

proBNP
 (physiologically *inactive*)

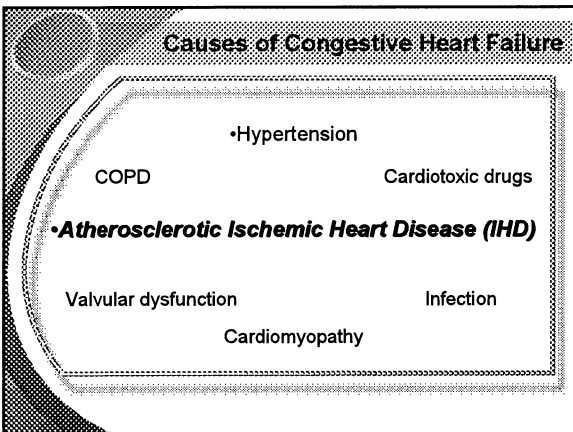

Intracellular

Characteristics of Natriuretic Peptides

	ANP	BNP	CNP
Structure	28 amino acids	32 amino acids	22 amino acids
Major sites of synthesis	Cardiac myocytes, production shifts from atria to ventricles in cardiac overload; induction of gene expression slow	Cardiac myocytes, central nervous system; induction of gene expression rapid	Vasculature, central nervous system
Major regulators of secretion	Myocyte stretch; vasoactive factors, stored in granules; plasma levels regulated at the level of hormone secretion	Myocyte stretch; regulation of secretion occurs mainly at the level of synthesis, especially in ventricular myocytes	Cytokines, growth factors
Major effects	Natriuresis, diuresis, vasodilatation; inhibition of renin secretion and angiotensin II actions	Natriuresis, diuresis, vasodilatation, inhibition of renin secretion and angiotensin II actions	Vasodilatation; inhibition of growth

Ruskoaho H et al. J Mol Med 1997;75:878-885

Epidemiology of CHF

Acute CHF affects over 1,000,000 annually in the US
Direct mortality - 42,000 deaths/year Indirect mortality - 220,000 deaths/year
Incidence - 500,000 new cases/year
Prevalence - 5 million (1.8%); 10% after age 75
CHF is the #1 cause of hospitalization for people over 65
Associated with a readmission rate of 30 - 40% in 90 days
CHF causes significant morbidity and mortality; 60% of men and 49% of women die within 5 years of diagnosis
Sudden death occurs at 6 - 9x the rate for the general population
Costs: \$21 Billion/year

Neurohumoral Changes

Heart Failure **Increases**

- Sympathetic nervous system activity (Epinephrine, NE)
- Endothelin
- Arginine vasopressin
- Renin and Angiotensin II
- Aldosterone
- Neuropeptide Y
- ANP and BNP
- Insulin, Cortisol, Growth hormone, Tumor necrosis factor- α , Interleukin 6, Vasoactive intestinal peptide, Adrenomedullin, Urotilatin
- Dopamine
- Prostaglandins (PGI₂, PGE₂)
- Vasodilator peptides, (e.g., Bradykinin)

NOTE: Measurements in individual patients vary significantly; changes may not always be present.

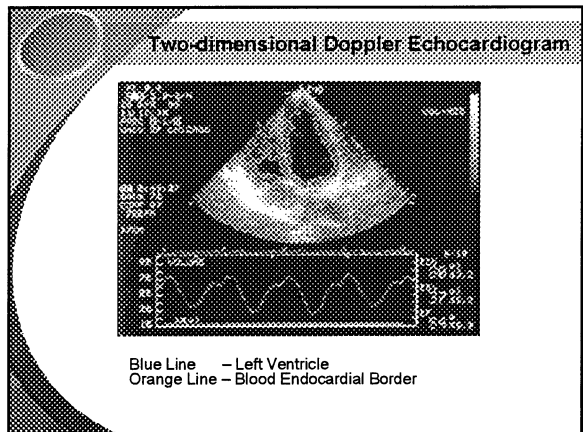

CHF May Be Difficult to Diagnose

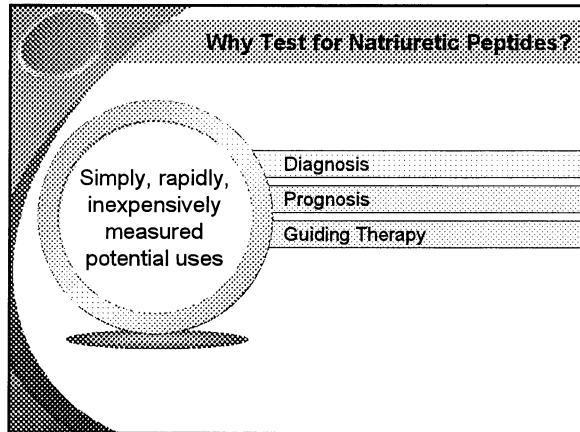

- Non-specific clinical signs and symptoms
- No Simple near patient diagnostic test
- Usual hospital diagnostic procedures:
 - Echocardiography
 - Cardiac catheterization
 - Radiography (radionuclide ventriculography)
- Problems: Not always available
- Time-consuming
- Expensive

Left Ventricular Ejection Fraction (LVEF)

$$LVEF = \frac{\text{Stroke Volume}}{\text{End Diastolic Volume}}$$

Stroke Volume = (End Diastolic Volume - End Systolic Volume)

Diagnosis

Predictor	P-value	Odds Ratio
HTN	0.03	2.3
Male sex	0.002	4.0
IHD	0.0003	6.0
BNP (> 12.9 pg/mL)	0.005	13.0
NT-proBNP (> 86 pg/mL)	<0.0001	14.5

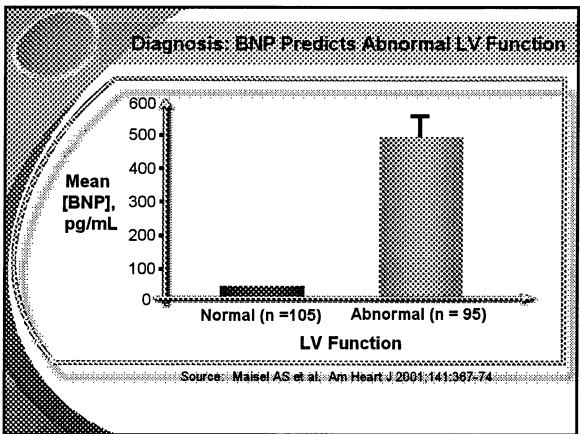

HTN, Hypertension; IHD, Ischemic Heart Disease; BNP, B-type Natriuretic Peptide, NT-proBNP, N-terminal proBNP

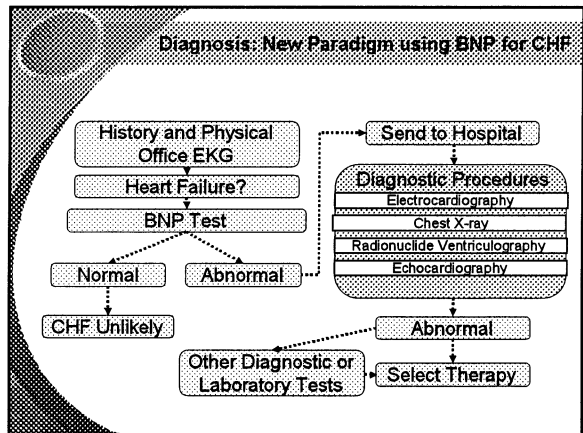

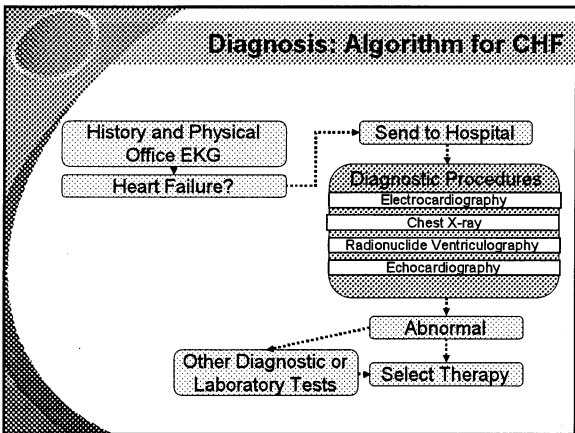

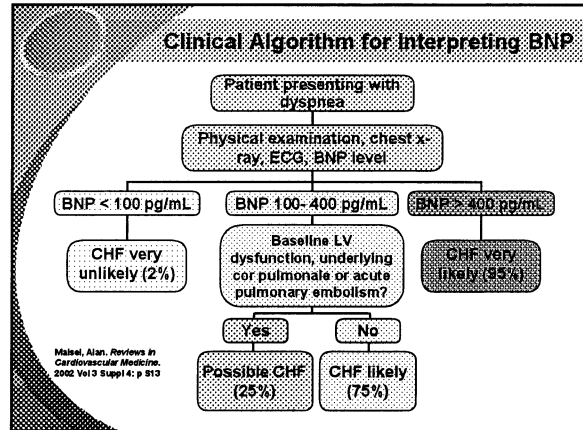

Diagnosis: BNP for CHF Screening

Type of patient population	General	Symptomatic PC
Sensitivity	76	97
Specificity	87	84
PPV	16	70
NPV	98	98

PC, Primary Care
PPV, Positive Predictive Value
NPV, Negative Predictive Value

Source: Struthers A. Heart 2000;84:334-38.

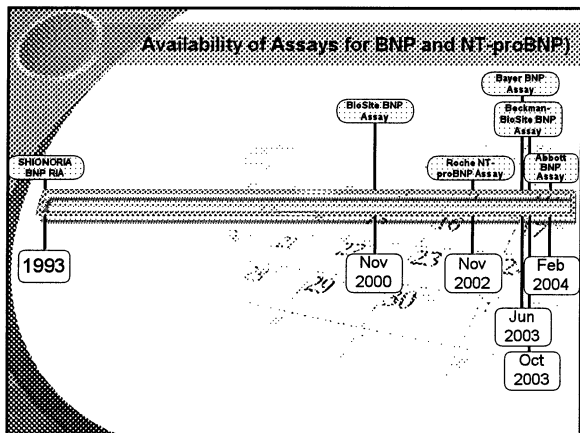

BNP Guided Therapy for CHF

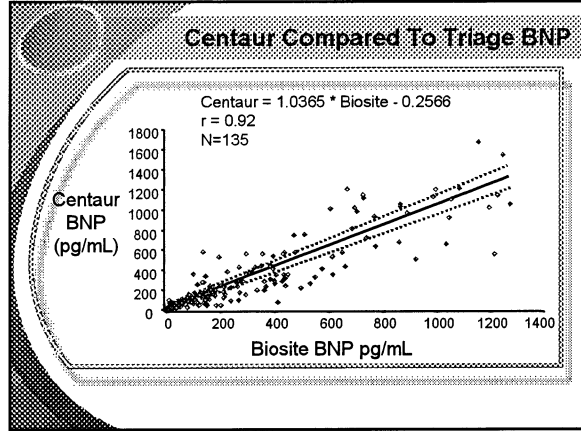

Trial

69 patients (LVEF <40%) and symptomatic HF (NYHA class IV)

Plasma BNP (n = 33) or standardized clinical assessment alone (n = 36)

Troughton et al. The Lancet 2000;355:1126-1130

Use of NT-proBNP Versus BNP

- BNP has been used in more studies & seems to correlate better with disease status.
- NT-proBNP circulates at higher levels
- NT-proBNP has a longer half-life (1-2 hours)
- BNP has a short half-life (<20 minutes)
- NT-proBNP will not cross-react with exogenous BNP
- Clearance of NT-proBNP dependent upon renal function

BNP and pro-BNP Degradation

In vivo:

- BNP: Natriuretic peptide receptors (A,B,C)
Neutral Zn²⁺-dependent glycoprotein metalloproteinases
Renal Excretion?
- proBNP: Reticulo-endothelial system
Renal Excretion

From: Allen Wu

BNP and NT-proBNP Degradation

In vitro:

- BNP: Shimizu et al. suggested that BNP is degraded by contact activation of the kallikrein system (extrinsic clotting).
Glass collection tubes can activate this extrinsic system
Arginine and kallikrein-specific inhibitors superior to serine proteinase inhibitors
- NT-proBNP: More stable in vitro because it is not degraded by proteinases.

Stability of Natriuretic Peptides in EDTA Whole Blood

Storage Temperature	BNP	NT-proBNP
Room temperature	24 h	5 - 72 h
4 °C (2 - 8 °C)	24 - 48 h	48 - 72 h
-20 °C	9 mo	12 mo

Table 31
Summary of Major Immunoreactivity of B-Type Natriuretic Peptides*

Peptide	Method		
	Access 2	ADVA Centaur	AxisYM
1-32	82	126	109
3-32	69	123	116
4-32	159	176	164
10-32	< 1	183	< 1
1-31	87	< 1	< 1

*Data are given as percentages. For proprietary information, see the text.

- ### Possible Reasons for Sex/Age Differences
1. Women have thicker walled hearts than men
 2. Estrogen effect (HRT) with postmenopausal women
 3. Declining GFR with age
 4. Obesity effect (BMI decrease with age)

Other Diseases with Increases in BNP

- Left Ventricular Hypertrophy
- Cardiac Inflammation (eg, Myocarditis, Cardiac Allograft Rejection)
- Arrhythmogenic Right Ventricle With Reduced Ejection Fraction
- Kawasaki Disease
- Primary Pulmonary Hypertension
- Pulmonary Embolism
- Renal Failure
- Ascitic Cirrhosis
- Endocrine (Primary Hyperaldosteronism, Cushing Syndrome)

Adapted, With Permission, From: Peacock WF IV. The B-type Natriuretic Peptide Assay: A Rapid Test For Heart Failure. Cleve Clin J Med 2002; 69: 243-251.

BNP Results Interpretation

Caveats

Age and Sex
Renal failure
Cirrhosis
Obesity
Other Conditions
Assays may not compare

Summary

- BNP is secreted by the ventricular myocardium in response to volume overload and increase stretch
- BNP is more commonly used but NT-proBNP will probably be equally useful
- The effectiveness of nesiritide validates the basic pharmacological properties of endogenously-produced BNP

Summary

- Diagnosis**
Strong NPV (~98%) for R/O of CHF
Potential use as a screening test (~70% PPV) in "at risk" population
- Prognosis**
BNP and NT-proBNP levels increase proportionately with CHF disease severity. Correlates to the NYHA classification system
Correlates with Left Ventricular Ejection Fraction (LVEF).
Assess risk of future episodes of CHF and Cardiac Events
- Guidance and monitoring of drug therapy**
Guide the selection therapy and monitor its efficacy.
Aids the physician in the choice and dosage of medication
